ROLE: PRODUCT UI/UX AND DESIGN

Make Kivi Worth Keeping

kivi
by Sarvam

Kivi can already turn speech into text across a person's computer. It has Styles, a Dictionary, shortcuts, and a growing number of ways to shape how it behaves.

Those are capabilities. They are not yet a reason for Kivi to matter.

Your assignment is to decide what Kivi should become—and then make that belief visible in the product. We are not giving you the position. Discovering it is the first half of the work.

There are two parts to this assignment. Complete them in order.

PART ONE

Product Position and Vision

Before designing anything, decide what Kivi is.

Use Kivi. Watch the demonstrations. Study the market, use competing products, read what their users praise and resent, and speak to people if it helps.

Then take a position.

Tell us:

- what Kivi should mean in a person's life;
- whom it should belong to;
- where it creates value that other products do not;
- why someone would choose to keep it;
- what it must refuse to become.

Your position should be specific enough to make some attractive product ideas wrong. A feature comparison, market map, collection of trends, or polished slogan is not a position.

SUBMIT

- a product positioning statement of no more than 100 words;
- a product vision document of no more than 600 words.

This part must be entirely your own thinking. Do not use generative AI to arrive at the position or to write either document for you.

We are interested in how you see: what you notice, what you connect, what you dismiss, and the conclusion you are prepared to defend. We will examine this reasoning closely during the interview. A borrowed position rarely survives that conversation.

Complete and preserve both documents before beginning Part Two.

PART TWO

Redesign Styles

Now make your position visible in the product.

Assume Kivi retains the same broad capabilities it has today. Redesign Styles as a complete product experience, from a person's first encounter with it to confident, repeated use.

Treat the current implementation as evidence, not as a template.

You may rename Styles, replace the page, change the interaction model, reorganize the product, remove existing concepts, introduce new ones, or reconsider Kivi's visual identity entirely. Nothing—including the current bird, navigation, terminology, or design language—needs to survive out of politeness.

Build a high-fidelity interactive prototype. It should feel like a product someone can operate, not a collection of attractive screens.

A new user should be able to understand what Styles is, why it matters, what it changes, and how to begin—without needing you beside them to explain the interface.

The product position from Part One should be visible in the structure, interactions, language, examples, and visual character of the redesign. The Styles experience should communicate what kind of product Kivi is and what kind of relationship it intends to have with its user.

The prototype may use mocked data and simulated product behaviour. It must still be interactive and internally consistent.

You may use AI during this part to help with design execution, prototyping, code, motion, or production. You must still understand and be able to defend every consequential decision in the finished work.

Do not design the version of Kivi you think we already want. Show us the version you believe deserves to exist.

Evaluations

There is no automated evaluation or hidden dataset for this task.

We will read the product position and vision first. We will then open and use the prototype.

We will evaluate:

- whether the position is original, specific, and defensible;
- whether the product design follows from that position;
- whether a new user can understand Styles and begin using it;
- whether the prototype represents a complete interaction rather than a gallery of screens;
- whether the interface, language, examples, motion, and visual identity tell the same story;
- whether the work demonstrates product judgment, technical plausibility, and restraint.

During the interview, we may challenge the position, remove a feature, or change a premise. You should be able to explain and reconsider the decisions in your work.

Submission

Place the complete submission in one GitHub repository.

The repository must contain:

- the product positioning statement;
- the product vision document;
- a README linking directly to the interactive prototype;
- an exported PDF or complete set of screens as a permanent reference.

The interactive prototype may be submitted in any of the following forms:

- a publicly accessible Figma prototype;
- a Framer prototype;
- a ProtoPie prototype;
- an equivalent graphic-design or interaction-design tool;
- a hosted interactive website;
- a locally runnable interactive application.

All of these forms are equally valid. Choose the one that best represents your work.

If the prototype is hosted externally, the README must contain the direct link. It must open without requesting permission, creating an account, or contacting you for access.

If the prototype runs locally, include its complete source in the repository and provide a `RUN.md` containing:

1. the required runtime and version;
2. the exact command to install dependencies;
3. the exact command to start the prototype;
4. the local URL or application window to open.

SUBMIT

Through the application form, provide:

- the GitHub repository URL;
- the exact final commit SHA;
- the direct prototype URL, if the prototype is hosted externally.

A reviewing agent will clone the submitted commit and follow the path declared in the README.

For an externally hosted prototype, the agent will open the supplied link. For a local prototype, the agent will follow `RUN.md`.

Test the complete review path before submitting. If the agent cannot seamlessly access and operate the prototype, we may be unable to review the submission.
